Ada Jacyna (20266113)

My contribution

In this project, my role was to implement the idea I suggested, when we were choosing our project topic: a functioning LLM evaluator. To do that, I implemented the module responsible for searching for function properties using an LLM, in the file `amr/recon.py`. I also implemented the general interfaces that the project based its approach on, both related to the LLM reconnaissance and PSO algorithm. I made sure that the LLM would hardly ever propose a negative solution, meaning that the wrong hint from LLM won't affect how correct the solution will be.

Additionally, I also created tests that checked correctness of my code, and, to avoid a direct Ollama import for just the tests, I imported it only in specific parts of code.

Apart from the code, I was also working together with my team. We came up with the solution together and later on, created a presentation by dividing the work. I was responsible for the tool evaluation describing as well as presenting it.

Peer evaluation

Yeskendir Assankul 10/10

If I could, I would give Yeskendir an 11. He was extremely eager to work, agreeable and pleasant to work with. As I was not responsible for the tool evaluation in the project, I had to analyse how he completed it and recheck all the data. Since he knew it best, I had to ask a lot of questions. He was patient and even when I pointed out mistakes or problems I or anyone else found, he would always say when he can look through it and he would fix it by that deadline.

Hugo Tarczyński 10/10

During the first meeting we all prepared ideas, but none of them were as innovative and promising as Hugo's. He patiently explained the complicated topic until the moment all the team members understood the idea. His idea was unanimously chosen as the project topic. He then implemented the core logic of the project, that being the PSO algorithm.

Jakub Skibicki 10/10

Kuba focused on the project's base. First, he created the repository so we would all start working on code. He was also focused on the "data" part of the project. Not the evaluation, but the functions and domains defining, as well as sampling the inputs.

Overall, his part was vital to the project's functioning, as without it we wouldn't even know if the algorithm does anything.
